

Alfido Tech - Zomato Dataset Analysis Report

1. Project Overview & Methodology

This project analyzes the Zomato restaurant dataset for Bengaluru. The goals were to perform comprehensive data cleaning (handling nulls, formatting strings like rating and cost), exploratory data analysis using visualizations (heatmaps, wordclouds, scatter plots), and implement a machine learning model to predict restaurant ratings.

2. Key Findings & Insights

- Location Hotspots: Areas like BTM, HSR, and Koramangala dominate the restaurant landscape.
- Rating vs Cost: Higher cost does not strictly guarantee a higher rating, but highly-rated premium options are consistent.
- Top Cuisines: North Indian, Chinese, and Fast Food heavily populate the dataset.
- Predictability: The number of 'votes' has the strongest correlation with the 'rate', highlighting the importance of customer engagement.

3. Recommendations for Platform Strategy

1. Strategic Partnerships: Focus partnership efforts on restaurants in high-density areas (BTM, Koramangala) that have high votes but moderate ratings to boost their performance.
2. Content Ideas: Launch a 'Budget-friendly Highly Rated' segment for restaurants with cost < 500 and rating > 4.0.
3. Engagement Gamification: Since 'votes' correlate with solid ratings, incentivize users on the platform to leave detailed text reviews and votes.
4. Feature Prioritization: Make 'Online Order' and 'Table Booking' primary filters, as they strongly impact overall customer satisfaction.
5. Targeted Expansion: Using the ML feature importance, location is critical. Introduce hyper-local marketing campaigns specifically tailored to top-performing neighborhoods.
